

Probability Calculator Guide

How to Use the MDragon Probability Calculator

Features

The Probability Calculator includes:

1. Basic probability rules
2. Combinatorics (permutations & combinations)
3. Expected value
4. Dice probability simulator

Module 1: Basic Probability

Addition Rule

When to use: Finding $P(A \text{ OR } B)$

Inputs:

- $P(A)$: Probability of event A
- $P(B)$: Probability of event B
- $P(A \text{ and } B)$: Joint probability (if applicable)

Output: $P(A \text{ or } B)$

Example:

$P(\text{King}) = 4/52$, $P(\text{Heart}) = 13/52$, $P(\text{King} \cap \text{Heart}) = 1/52$

Result: $P(\text{King or Heart}) = 16/52$

Multiplication Rule

When to use: Finding $P(A \text{ AND } B)$

Types:

- Independent: $P(A) \times P(B)$
- Dependent: $P(A) \times P(B|A)$

Module 2: Combinatorics

Permutations (nPr)

When to use: Order matters

Formula: $n!/(n-r)!$

Example: 3-digit codes from 9 numbers

Input: $n=9$, $r=3$

Result: 504 codes

Combinations (nCr)

When to use: Order doesn't matter

Formula: $n!/(r! \times (n-r)!)$

Example: Choose 3 people from 10

Input: $n=10$, $r=3$

Result: 120 committees

Module 3: Expected Value

When to use: Finding average outcome

Formula: $E(X) = \sum [x \times P(x)]$

Example: Game where you win \$10 ($p=0.3$) or \$0 ($p=0.7$)

$E(X) = 10(0.3) + 0(0.7) = \3

Module 4: Dice Simulator

Features:

- Roll 1-6 dice
- Calculate probability of sums
- Visualize distribution

Example: Probability of rolling 7 with 2 dice

Result: $6/36 = 16.67\%$
